Unified Messaging

Unified messaging (or UM) is a business term for the integration of different electronic messaging and communications media (e-mail, SMS, fax, voicemail, video messaging, etc.) technologies into a single interface, accessible from a variety of different devices.

Sequential Ringing

Enables users to define a list of phone numbers that ring sequentially when a call comes in that meets the determined criteria. While this service rings number after number searching for the user, the calling party hears a greeting, followed by periodic comfort announcements. The caller can also press a key to interrupt the search and leave a message.

Simultaneous Ring

Enables users to have multiple phones ring simultaneously when a call comes in that meets the determined criteria. The first phone to be answered is connected. For example, calls to a user's desk phone could also ring the user's mobile phone, in case the user is not at his or her desk.

Mobile Client

A mobile application, most commonly referred to as an app, is a type of application software designed to run on a mobile device, such as a smart phone or tablet computer. Mobile applications frequently serve to provide users with similar services to those accessed on PCs.

Selective Call Acceptance

Selective Acceptance is a user-level feature that blocks all calls except for calls that occur under pre-defined criteria. You can block calls by phone number, time of day, holiday, or any combination of these.

Selective Call Rejection

This service enables a user to define criteria that causes certain incoming calls to be rejected and provided a treatment. All other calls terminate as usual. Selective Call Rejection allows a user to block calls that meet user-configurable criteria.

Distinctive Ring

Distinctive ring, marketed under a variety of names, is a service offered by a telephone company that establishes additional telephone numbers on the same line as an existing number, each number ringing with a distinctive ringing pattern.
